Convert and transfer data from PostgreSQL format to Microsoft Access. The software is capable of transferring entire tables and allows you to even perform batch table migration. You may easily configure a task using the dedicated wizard or a query. PostgresToAccess Torrent Download is capable of exporting tables or entire schemas from PostgreSQL to Microsoft Access databases, in a quick and easy manner. The data structures are first converted in order to fit the MS Access format, then easily imported to the selected database. The application prompts you to connect to both programs in order to ensure a smooth and quick data transfer. You need to have PostgreSQL already installed and to connect to the desired database. For the database destination, however, MS Access, you are only required to load the supported file (in.MDB or.ACCDB format). Once the software recognizes both the source and the destination file, all you need to do is select the desired tables, then configure the transfer parameters. For instance, the software allows you to preview the structure of the source schema and select only the fields you wish to transfer. Alternatively, you may also add new tables or data to the source schema, then instantly convert and transfer them to the destination. The data transfer can be done in one of three modes: append the already existing information in the destination file, update or replace it with the new tables. The transfer can be done on demand, but you may also schedule tasks to be performed at a later time. Moreover, you can set the task to be automatically performed according to a recurrent schedule. You may easily create SQL queries in order to determine the source tables or to control the entire process. Additionally, you may save the current session to your computer, so you can load it later, as well as creating batch (.BAT files).
